

Install once. Launch anytime.

ONE LOCAL SOURCE OF TRUTH

OrgChart Studio runs locally after first-time setup.

01 FIRST INSTALL OR UPDATE

Copy both commands below. No GitHub account or authentication is required. Setup explains the optional local ChatGPT Desktop / Codex MCP companion. At its prompt, type y and press Return to install it; pressing Return alone skips it. MCP works only while OrgChart Studio is open. Restart that desktop client once after installation.

```
/usr/bin/curl --fail --location --show-error \  
  --output "$HOME/Downloads/orgchart-studio-install.zsh" \  
  "https://raw.githubusercontent.com/adammalin/Org-Chart-Studio/refs/heads/main/scripts/bootstrap-mac-source-test.zsh"  
  
/bin/zsh "$HOME/Downloads/orgchart-studio-install.zsh" \  
  "$HOME/OrgChart-Studio-source-test"
```

MCP PROMPT: type y and press Return to install the local AI companion.

TO UPDATE LATER: quit OrgChart Studio, then run these same two commands again.

02 START ORGCHART STUDIO AFTER INSTALL

For later sessions, open Terminal and run. Open the app before using its optional local ChatGPT/Codex tools:

```
/bin/zsh "$HOME/OrgChart-Studio-source-test/scripts/start-mac-source-test.zsh"
```

03 FIRST WORKING SESSION

Create a blank chart, or use Sources & imports to validate a reviewed CSV, Excel, or JSON file. Then open Backup & restore. Keep the live library in a local folder and select a different backup folder. OneDrive or Dropbox is appropriate only for the encrypted backup package.

LIVE DATA

Choose local only

Keep the working database outside Git, OneDrive, Dropbox, and iCloud.

ENCRYPTED BACKUP

Choose separately

A OneDrive or Dropbox folder may receive the encrypted .orgchart-backup file.

SAFE MIGRATION

Restart to verify

The app copies and checksums data, switches, and keeps the old recovery copy.

REQUIREMENTS

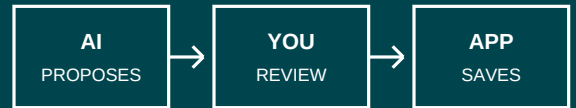

macOS 13+ | Internet | Public GitHub repository access

Managed Mac: follow approved processes. Use the red X or Command-Q to stop the app and local server.

Draft source test - not a signed /Applications package or an approved production system.

<https://github.com/adammalin/Org-Chart-Studio>

Use AI with OrgChart Studio.

HUMAN REVIEW STAYS IN THE LOOP

AI stages edits and imports. You decide. The app remains the source of truth.

01 BEFORE THE FIRST AI EDIT OR IMPORT

1 INSTALL

At the MCP prompt, type y and press Return.

2 RESTART

Restart ChatGPT Desktop or Codex once.

3 OPEN APP

OrgChart Studio must be running first.

4 SCOPE

Allow charts. Retained-source reading stays off.

02 COPY THIS PROMPT

Change the chart name, person, and requested update to match your task.

```

Use the orgchart_studio MCP server.
First list the available charts and find the DVCD chart.
Read its current data, then stage a proposal marking Renee's
position vacant because she is retiring.
Do not create a separate chart or generic diagram.
Let me review the proposed change inside OrgChart Studio
before it is saved.
  
```

03 WHAT HAPPENS NEXT

1 LIST & READ

Find the chart and inspect its current data.

2 STAGE

AI prepares a proposal; the saved chart stays unchanged.

3 REVIEW

The app shows the exact proposed fields and layout.

4 DECIDE

Choose Apply reviewed changes or Reject proposal.

5 VERSION

After Apply, save a meaningful named checkpoint.

04 MCP BOUNDARIES

MCP CAN

- List allowed charts and intake metadata
- Extract approved source content after opt-in
- Stage a reviewed import or source recheck
- Create a private pre-recheck rollback file

MCP CANNOT

- Delete charts or restore backups
- Return raw source files or passphrases
- Change storage or publish
- Bypass review for chart replacement

IF THE SERVER IS MISSING

Rerun the installer, type y at the MCP prompt, then restart ChatGPT Desktop or Codex.

If it says unavailable, open OrgChart Studio. Local MCP works in the desktop app/Codex, not ChatGPT web.

Source extraction is off by default. Returned chart fields and extracted content enter the AI conversation.
